

Nordost Odin 2

CABLE CABLE SYSTEM

The Nordost Odin 2 cable system might date back to 2015, but it remains the standard by which other high-end cables are judged. It is the successor to the original Odin and features the sophisticated and hard-to-install HOLO:PLUG terminator, which creates an optimal interface between the cable and the component. The cables are precisely built and calibrated to work together, with different designs (and optimum lengths) for power cords, interconnect cables, and loudspeaker cables. Odin 2 uses a Dual Monofilament layout, with silver-plated high-purity solid-core copper strands. The mechanical properties of the cables are optimised with additional shielding and spacing tubes, known collectively as Total Signal Control.

Always exceptional

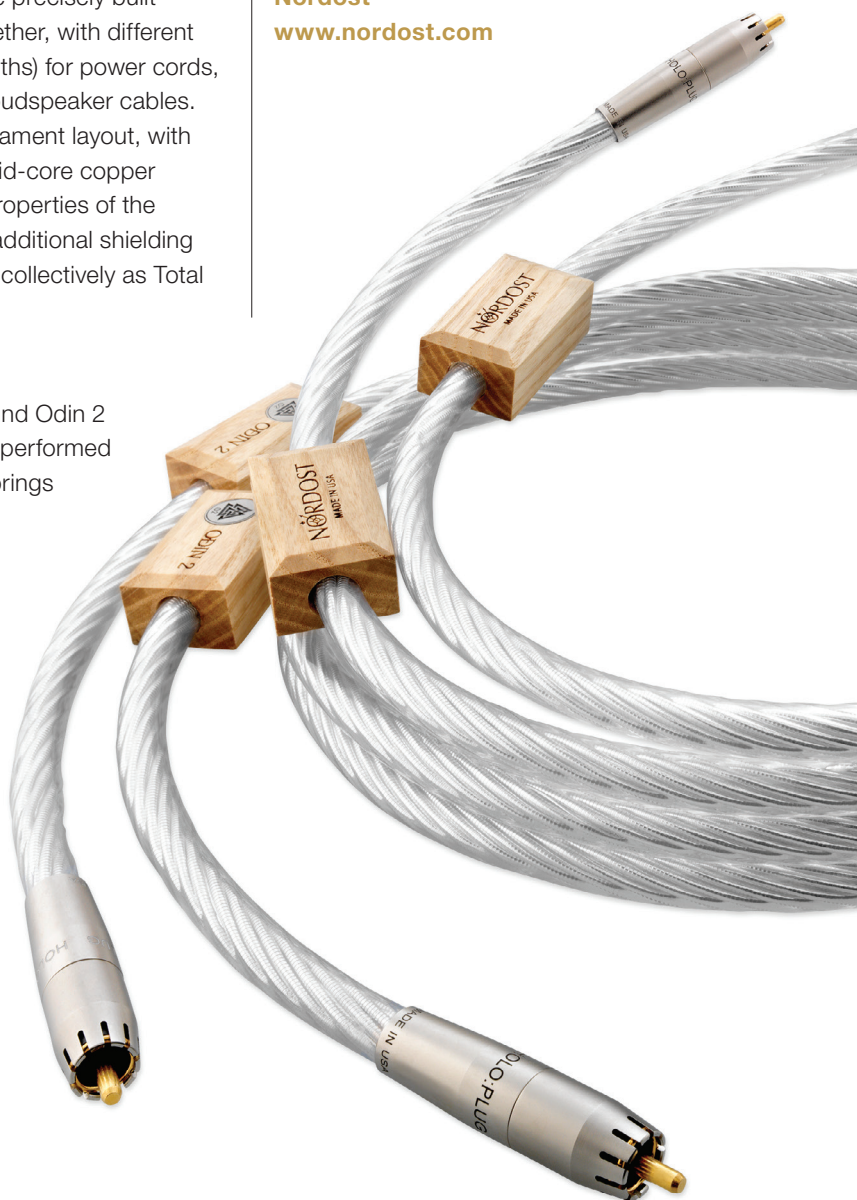

In our test, Alan Sircom found Odin 2 cable system components performed exceptionally well. Odin 2 brings a sense of integration and coordination to a system, making it sound more cohesive and allowing it to take advantage of improvements from other devices. It helps extract extraordinary degrees of soundstage width, detail, dynamics, attack, resolution, articulation, solidity, and transparency.

A system using Nordost Odin 2 reproduces music with speed, honesty, and integrity, capturing the recording's emotion and 'feel'. Almost 10 years after its launch, Nordost's Odin 2 remains one of the best cable systems available, setting the highest possible standards for accuracy and detail retrieval.
